

Specific Target

Application: TANKERS & VACUUM TRUCKS

The Challenge: Companies in North America have the constant challenge of keeping their equipment looking clean and new. Metal tanks need routine maintenance and re-painting to keep on top of corrosion problems. Aluminum or stainless do not suffer the same corrosion problems, but need protection from constant abrasion on gravel roads; without protection they too will look old and unkept.

The Solution: LINE-X Protective Coatings, applied over a properly prepared substrate will eliminate corrosion from the equation. PLUS added benefits include chemical resistance, abrasion resistance, impact resistance, slip resistance and just plain good looks. LINE-X will extend the life of an old tank and offers limited structural enhancement as well. Retrofit or new, LINE-X is the answer. And protection doesn't have to start and stop with the tank; LINE-X is an excellent choice for cab elements as well as rocker panels, fenders, grilles, railings, ladders, etc.

The Process: Equipment is dropped off at our LINE-X shop. On new, structurally sound paint, area to be coated is masked, cleaned and abraded for the LINE-X coating. For used equipment, the cleaning process includes sand blasting and removal of any pre-existing corrosion, loose paint, etc. Accessories are carefully protected and/or removed as necessary. Cleaned substrates are then primed with LINE-X primer and coated with the appropriate LINE-X coating through our heated high pressure impingement application equipment. Topcoat can be applied if requested. Following application of LINE-X the vehicle is unmasked, accessories are replaced and the unit is ready to go. Full cure is complete in 24 hours.

Extremely quick set-up time (2-3 seconds) allows LINE-X to be sprayed at any angle without any resulting drips, runs or sags. Color can be matched to any color.

The Result: With limited down time, and greatly reduced future maintenance, equipment is ready to serve for the long haul.
